

Abstract

A manipulation suppression program, a manipulation suppression method and a video game machine are provided which are capable of suppressing an inhibited act that is conducted by a user. A main-game execution section executes a main game; while the main game is executed, an inhibited-act detection section detects a manipulation by a user being a preset inhibited act; and if the inhibited act is detected by the inhibited-act detection section, a suppression-information presentation section displays, in a display section, a suppression picture which prompts the user to suppress the inhibited act.
